

AI Engineer for Developers Associate Certification Study Guide

Please use this study guide to create your certification self-study plan. We've included the objectives you should meet for each assessed competency, with links to relevant practice assessments.

Exam AIEDEVA101: AI Governance, AI model usage, Production System & Application Development for AI, Programming for AI (Python)

1.1. Describe best practices for mitigating privacy and safety issues when using generative AI models

- Describe best practices for mitigating privacy issues when using generative AI models
- Describe best practices for mitigating safety issues when using generative AI models

1.2 Manage risk and security when using generative AI models

- Describe the techniques to limit prompt injection
- Recall the risks associated with releasing new AI models

1.3 Understand and apply core concepts in AI and in implementing AI solutions

- Describe key concepts of machine learning and implement them on real-world datasets
- improve model performance by both preprocessing data and regularizing your models
- identify and use appropriate pre-trained models for the task to be completed

1.4 Understand and apply key concepts in LLM

- define and describe the key stages of LLMops
- design and implement semantic search engines using vector databases and distance metrics
- leverage embeddings to enable and enhance semantic AI applications
- understand how to chain dataflows for automated decisioning and intelligence integrated with LLM providers

AI Engineer for Developers Associate Certification Study Guide

1.5 Write, apply and refine efficient prompts

- build a Chatbot using Prompt Engineering principles and best practices
- demonstrate understanding of key concepts of Prompt Engineering and how to implement them for real-world applications
- distinguish between different kinds of prompts

1.6 Understand and apply core concepts in implementing AI solutions

- Create and manage API requests and endpoints

1.7 Use AI Engineering principles to design, implement and manage complex systems

- design and implement a chatbot that effectively manages conversation history
- Understand principles behind development of AI applications, spanning multiple platforms and use cases
- Use vector databases to create and interact with embeddings and indexes

1.8 Demonstrate understanding of common software engineering principles and conventions

- Understand the minimal requirements for a Python package and how to create one
- use comments, self-documenting code, & docstrings to make python projects more readable & maintainable.
- Use functions, classes and inheritance to add functionality to Python projects
- utilize pytest to write unit tests for python packages.
